The invention relates to a method for manufacturing cell delivery particles, pharmaceutical component-particle dispersions, composition comprising cell delivery particles and pharmaceutical compons. comprising pharmaceutical component-particle dispersions. The method comprises homogenization of mixts. comprising amphiphilic components and a block copolymer to form stable particles. The invention is also directed to cell delivery particles and pharmaceutical component-particle dispersions produced by the claimed methods and compns. comprising same. In certain embodiments, the cell delivery particles may further comprise co-lipids. The invention further relates to methods of generating an immune response, treating or preventing a disease or condition, or delivering a biol. active mol. to cells in vitro comprising administration of the pharmaceutical compns. described herein. When certain Poloxamer solns. are subjected to high pressure homogenization in the presence of the cationic lipid DMRIE, small uniform particles are produced with a pos. surface charge. When DNA is incubated with these particles, a stable cell delivery particle is produced that has a pos. surface charge in the presence of a molar excess of DMRIE and a neg. surface charge when using a molar excess of DNA.

The present invention relates to a novel method for producing formulations comprising a polynucleotide, block copolymer and cationic surfactant. The formulations produced by the current method are suitable for use in polynucleotide-based medicaments. A suitable method of production disclosed herein addnl. comprises cold filtering a mixture of a polynucleotide, block copolymer and cationic surfactant, thereby sterilizing the formulation. The method of the present invention also eliminates the need for thermal cycling of the formulation, thereby reducing the time and expense required to produce large quantities of a formulation during com. manufacturing The present invention also relates to novel cationic lipids used as surfactants. For example, a naked VR4700 plasmid DNA (5 mg/mL) in PBS was formulated with poloxamer CRL-1005 (7.5 mg/mL) and benzalkonium chloride (0.3 mM), using the thermal cycling and filtration process. Particle size of the diluted poloxamer formulation were maintained by thawing the

- AB This invention relates generally to the freeze-drying of formulations comprising a polynucleotide, a block copolymer and a cationic surfactant. In the presence of a cryoprotectant or bulking agent, a formulation can be freeze-dried, whereby upon reconstitution of the dried formulation, the microparticles maintain their optimal size and aggregation or fusion is avoided. For example, a DNA/poloxamer/benzalkonium chloride (BAK) formulation (5 mg/mL DNA, 7.5 mg/ mL CRL-1005, 0.3 mM BAK) in 10% sucrose and 10 mM sodium phosphate vehicle was prepared and lyophilized.

AB The present invention relates to methods of producing lung

surfactant formulations through solvent dissoln. and lyophilization as well as surfactant formulations derived therefrom. The invention also relates to the methods of treating respiratory dysfunction in a patient comprising administering a lyophilized lung surfactant composition produced by the methods described herein to a patient.

The present invention provides long-term stable formulations of lyophilized keratinocyte growth factor and methods for making a

lyophilized composition comprising keratinocyte growth

factor. For example, formulations containing keratinocyte growth factor together with mannitol and sucrose had improved stability.

PRIORITY APPLN. INFO.:
     The present invention is a substantially non-adhesive elastic gelatin
     matrix. The matrix is both non-adhesive to wounds, tissues and organs and
     is also elastic such that it is flexible. The matrix is a
     lyophilized mixture of protein(s), polymer(s),
     crosslinking agent(s) and optional plasticizer(s). The invention also
     provides methods for making the non-adhesive elastic gelatin
     matrix. For example, a drug delivery film contained sirolimus, gelatin
     300 Bloom, sodium alginate, PEG, EDC and NHS, silver lactate.

PRIORITY APPLN. INFO.: EP 2003-16057 A 20030715 <-AB The invention relates to an apparatus and method for preparing samples
for chemical reactions, especially for carrying out the polymerase chain
reaction

(PCR). The apparatus has an inflow and outflow for elution buffer, and between the two is a number of membranes. The membranes are designed for preparing the samples from cell lysates and for carrying out the chemical reaction, namely, PCR. The steps include purifying the polynucleotides from the cell lysate, binding the former on a carrier membrane with lyophilized reagents designed for PCR, followed by eluting the polynucleotides from the carrier membrane. The apparatus and method allow to avoid expensive and time-consuming procedures.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

Radio-opaque biodegradable compositions are formed by modifying terminal groups of synthetic and natural biodegradable polymers such as polylactones with iodinated moieties. The biodegradable property of the compositions renders them suitable for use in medical field such as drug delivery, imaging. Compounds disclosed in this invention exist as neat liquid. Certain compositions disclosed in this invention form hydrophobic iodine rich domains when dissolved in water, such domains provide better contrasting properties as well as ability to dissolve hydrophobic bioactive drugs. Certain iodinated moieties

disclosed in the invention are capable of cross linking natural proteins in situ in presence of suitable catalysts and co-catalysts.

The invention provides a liquid composition and a lyophilized AΒ composition comprising a therapeutically effective amount of a conjugate comprising an antibody chemical coupled to a maytansinoid. The invention further provides a method for killing a cell in a human comprising administering to the human either of the compns. such that the antibody binds to the surface of the cell and the cytotoxicity of the maytansinoid is activated, whereby the cell is killed.

This invention is directed to the field of medical implants, and more specifically to biodegradable injectable implants and their methods of manufacture and use. The injectable implants disclosed herein comprise glycolic acid and bio-compatible/bio-absorbable polymeric particles containing a polymer of lactic acid. The particles are small enough to be injected through a needle but large enough to avoid engulfment by macrophages. The injectables of this invention may be in a pre-activated solid form or an activated form (e.g., injectable suspension or emulsion). For example, a lyophilized composition was prepared containing glycolic acid 0.07 mg, poly(lactic acid) spheres 200.0 mg, hydroxypropyl Me cellulose 118.33 mg, D-mannitol 170.0 mg, pH stabilizer (phosphate buffer) 0.50 mg, and surfactant (Tween 80) 1.20 mg. The composition was activated extemporaneously with 5.5 mL water to obtain an injectable preparation

Disclosed are a composition for use in preparing a lyophilized product which comprises a polymer micelle encapsulating a drug, and a saccharide and/or polyethylene glycol as a stabilizing agent; a lyophilized preparation from the composition; and methods for preparing the composition and the preparation The lyophilized preparation can be again converted with ease

aqueous preparation using an aqueous medium. For example, a freeze-dried preparation containing

paclitaxel encapsulated in polyethylene glycol-benzyl aspartate block copolymer and maltose as stabilizer was prepared

AB The present invention relates to a process for preparing submicron sized nanoparticles of a poorly water soluble compound by lyophilizing a dispersion or microdispersion of a multiphase system having an organic phase and an aqueous phase, the organic phase having the

poorly water soluble organic compound therein. The method is preferably used to prepare nanoparticles of a poorly water soluble, pharmaceutically active compound suitable for in vivo delivery, particularly by parenteral routes.

The present invention provides delivery vehicles comprising a synthetic, poorly crystalline apatite (PCA) calcium phosphate and a biol. active agent. The PCA calcium phosphate offers many advantages over known delivery materials and is particularly useful for delivery of agents to bone sites, the central nervous system, i.m. sites, s.c. sites, interperitoneal sites, and ocular sites. The invention also provides methods of preparing delivery vehicles, of altering delivery vehicle characteristics, and of delivering biol. active agents to a site. The invention is useful for both medical and veterinary applications. Bovine pancreatic trypsin was incorporated into a mixture of ammonium calcium phosphate and dicalcium

phosphate dihydrate paste. The mixture was then lyophilized, and ground to make a powder. 126

AB The present invention relates to an anhydrous liquid composition wherein monoglyceride is mixed with an emulsifier and a solvent, and the manufacturing method thereof, and more specifically, to an anhydrous liquid composition wherein monoglyceride is mixed with a water-insol. material, an emulsifier and a solvent, and the manufacturing method thereof. Further, the present invention relates to a lyophilized powder and the manufacturing method thereof, wherein the lyophilized powder is prepared by dissolving the mixed liquid composition in water, adding with a cryoprotectant followed by the lyophilization. In the process of dispersion, the lyophilized liquid composition and the powder of the present invention can spontaneously generate particles of 200-500 nm by gently shaking with hands without a powerful mech. force. Also the lyophilized liquid composition and the powder of the present invention are physicochem. stable since they neither contain water that causes oxidation or hydrolysis upon storage nor undergo phase separation Considering all the raw materials of the present invention are biocompatible, the present invention will be useful in medical and pharmaceutical fields such as drug delivery. Monoolein 140, Pluronic F-127 28, rifampicin 0.7, PEG-400 180 mg, and ethanol 1.4 mL were mixed to

obtain a liquid formulation from which rifampicin was release over 120 h. , 4 . THERE ARE 4 CITED REFERENCES AVAILABLE FOR THIS REFERENCE COUNT: RECORD. ALL CITATIONS AVAILABLE IN THE RE FORMAT

Dried hemoactive materials comprise both a crosslinked biol. compatible AB polymer and a non-crosslinked biol. compatible polymer. The crosslinked polymer is selected to form a hydrogel when exposed to blood. The non-crosslinked polymer is chosen to solubilize relatively rapidly when exposed to blood. The non-crosslinked polymer serves as a binder for holding the materials in desired geometries, such as sheets, pellets, plugs, or the like. Usually, the crosslinked polymer will be present in a particulate or fragmented form. The materials are particularly suitable for hemostasis and drug delivery. Examples are given for production of uncrosslinked gelatin powder, production of lyophilized composite mixture of crosslinked and uncrosslinked biopolymer in sheet form, and used of lyophilized composite material as a hemostatic.

     A lyophilized polynucleotide composition contains
AB
     at least one polynucleotide and at least one cryoprotectant,
     wherein the ratio of the polynucleotide to cryoprotectant is
     from about 0.001 to about 1.0 part by weight polynucleotide per 1.0
     part by weight of the cryoprotectant. This composition also contains from
about
     0.5 weight percent to about 6 weight percent water, based on the total weight
of
     the final lyophilized polynucleotide composition
     The polynucleotide composition of this invention is characterized by
     enhanced stability, in that it retains at least 90 % supercoil over a time
     period of at least 10 days at a temperature of about 37 >C. The
     lyophilized polynucleotide composition also has
     improved solubility An improved process for lyophilization of
     polynucleotides employs a specific primary drying cycle, that
     results in the above-described stable, lyophilized
     polynucleotide composition

AB Novel extended polymer surfactants comprising a methoxy-terminated polyethylene glycol hydrophilic block acylated with a hydrophobic moiety comprising a chain of at least 2 fatty acid units, e.g. an acyloxyacyl group such as 16-hexadecanoyloxyhexadecanoyl, are useful in the preparation of polymer-based gas-containing contrast agents by emulsion techniques. Thus, ethylidene bis(16-hydroxyhexadecanoate) was prepared and treated with adipoyl chloride to give a polymer. A 3% solution of the above polyester (16 mL) in (-)-camphene was mixed with 64 mL of an aqueous solution of PEG Me ether 16-hexadecanoyloxyhexadecanoate and 5% PEG and the mixture was lyophilized to give a white powder.

AR Disclosed are a com	mositio	on for the	lyophilization of	

by removing water by sublimation. Also disclosed are red blood cells lyophilized according to this method for lyophilization, and a method for reconstituting the lyophilized red blood cells. In particular, the composition used to lyophilize the red blood cells comprises a mixture of a hydrophilic polymer ranging from 1,450-20,000 Daltons at 5-50% w/v, a mono- or disaccharide or a mixture thereof from 0.01-0.2M and an organic solvent such as a primary alc., a secondary alc., DMSO or combinations thereof at 0.5-20% volume/volume Examples of hydrophilic polymers are PEG, dextran, hydroxyethyl starch, and polyoxyethylene 23 lauryl ether; examples of carbohydrates are sucrose, glucose and fructose; examples of solvents are 1-butanol and DMSO.

AB Lyophilized limid o	ompns. as well as	s methods for their m	

AB Lyophilized lipid compns. as well as methods for their preparation, are embodied by the present invention. Gas-filled microspheres prepared using the lyophilized lipid composition are particularly useful, for example, in ultrasonic imaging applications and in therapeutic

drug delivery systems. A method for preparing the microspheres comprises (1) obtaining a lyophilized lipid composition comprising dipalmitoylphosphatidylcholine, dipalmitoylphosphatidylethanola mine/polyethylene glycol, and dipalmitoylphosphatidic acid, where the combined concentration of lipids is 20-50 mg/mL of an aqueous solution prior to lyophilization, (2) dispersing the lyophilized composition

in an aqueous based carrier to 0.1-5 mg/mL to form an aqueous microsphere-forming

solution, (3) introducing a fluorine-containing gas into the aqueous microsphere-forming solution, and (4) shaking the aqueous microsphere-forming solution to form a microsphere filled with fluorine-containing gas.

A lyophilized catalase composition with improved properties AB comprises a catalase conjugate with "low-diol" PEG and a cyclodextrin. The cyclodextrin acts as a cryoprotectant which prevents catalase aggregation. Preparation of catalase-PEG conjugates using low-diol PEG (i.e. PEG containing, on average, only one free hydroxyl) results in conjugates with better serum half-life and lower immunogenicity. The lyophilized PEG-catalase composition is prepared by carboxylating monomethoxy-PEG (i.e. the diol content of the monomethoxy-PEG is <10%), esterifying the carboxy group, reacting the catalase and activated PEG, preparing a solution of PEG-catalase and cyclodextrin, and lyophilizing the solution Reconstitution of the lyophilized catalase composition provides a solution which can be used in parenteral therapy for treatment of disease conditions caused by H2O2, such as inflammation, ischemia, reperfusion damage, trauma, and stroke. Methods of preparing low-diol or zero-diol monomethoxy-PEG and derivs. thereof, use of these derivs. to prepare numerous PEG conjugates, and improved shelf-life of the compns. were demonstrated.

ABAn antitumor lyophilized composition contains (1) a conjugate comprising N-alkyl methacrylamide-based copolymer and an anthracycline glycoside linked through a peptide spacer to the copolymer and (2) a solubilizing agent. Optionally, a targeting moiety is linked through a peptide spacer to the polymer. The composition shows a reduced dissoln. time when reconstituted with an aqueous diluent. A freeze-dried preparation containing a conjugate of doxorubicin with N-(2hydroxypropyl) methacrylamide polymer and Gly-Phe-Leu-Gly spacer, equivalent to doxorubicin 5 mg, polysorbate 80 2mg, and lactose 140 mg was reconstituted with water in <1 min.

     A method is provided for qual. detecting in vitro the presence
     or absence of selected circulating antibody types using a diagnostic kit
     comprising reconstituted, after lyophilization or evaporative drying, red
     blood cell samples or other cell or cell-like material (e.g. liposomes)
     which have antigens which are recognized and bound by the selected
     antibody type to be screened. Diagnostic kits containing the lyophilized
     blood samples of the invention have improved shelf life and may comprise
     samples packaged in a variety of forms convenient for manual single-test
     uses or automated multiple-test uses. The methods and kits of
     the invention are useful for blood typing. The method of the
     invention is demonstrated with respect to e.g. an agglutination assay with
     human red blood cells. Methods for detection of other ligands
     (e.g. steroid hormones, nucleic acids) are also claimed.

     Water-soluble acrylamide-Na acrylate copolymer was synthesized by the inverse
AB
     emulsion polymerization method. Incorporation of high
     hydrophile-lyophile balance coemulsifier in addition to the water-in-oil type
```

main emulsifier increased the rate of polymerization significantly. Some type of

phase transfer catalyst also increased the monomer conversion significantly. The emulsifier mixture system with bulky lyophilic group resulted in good latex stability possibly due to formation of a steric barrier which prevented the particles from agglomerating.

A frozen mixture of solubilized brain proteolipid proteins in CHCl3-MeOH is not sublimable in a vacuum. However, when 7 to 10 vols. of benzene were added to a CHCl3-MeOH solution containing 5 mg of proteolipid protein per mL, the

proteolipid proteins remained in solution for a while and the frozen mixture was easily sublimated at 2 mm Hq. Before the addition of benzene, higher concns. of protein required the acidification of the medium to avoid precipitation

of proteolipid proteins. In contrast to what happens when proteolipid proteins are obtained by the evaporation of the organic mixture at room temperature, the

protein obtained by lyophilization was soluble in aqueous solns. of ionic and nonionic detergents. SDS (0.5-0.7%) completely solubilized the proteolipid protein obtained by lyophilization. With the nonionic detergents Lubrol WX and Triton X-100, a solubilization between 50 and 65% was achieved. Na deoxycholate was practically ineffective. Triton X-100 showed selectivity in solubilizing certain proteins. The role of lipids in the solubilization of proteolipid proteins with detergents is discussed.

Lyophilization of cosolvent systems may be a beneficial way of enhancing AB both physical and chemical stability of a drug product. The objective of this research is to establish whether cosolvent systems commonly used in the formulation of poorly water-soluble drugs can be successfully lyophilized. Polyethylene glycol (PEG) 400 was selected because it is widely used and can be easily frozen. The addition of PEG 400 to commonly used bulking agents, such as mannitol, sucrose, or polyvinylpyrrolidone, caused a significant change in the thermal properties of the bulking agents as observed by modulated differential scanning calorimetry. In addition, PEG 8000 was evaluated as a bulking agent because it also can function as a cosolvent in solution and forms an acceptable cake after lyophilization. Addition of PEG 400 to PEG 8000 caused negligible changes in the thermogram of this bulking agent. Surprisingly, the combination of PEG 8000 and PEG 400 forms a solid lyophilized cake. The current system can be best described as the lyophilization of a miscible solution of PEG. 8000 and PEG 400 resulting in a lyophile that has a crystalline structure of PEG 8000 which is able to support PEG 400. A system is described in which manipulations of nucleic acids are performed in wells containing predispensed lyophilized reaction mixtures requiring addition of only nucleic acid. This allows increased reproducibility for single-step reactions (e.g., restrictions and ligations), as well as improved productivity for complex reactions (e.g., sequencing). Enzymes, co-factors, nucleotides and buffers can be dried and stored at room temperature without loss of essential function. When used for DNA sequencing, hundreds of templates a day can be sequenced with the potential to determine megabase amounts of sequence per week.

PROBLEM TO BE SOLVED: To obtain a pigment compound having excellent redispersibility, fluidity and color deepness, and slight in

dust-generating tendency.

SOLUTION: This pigment compound comprises a pigment and/or carbon black, a polymer and/or crosslinked polyoxyethylene acrylic acid, and a surfactant selected from the group consisting of aliphatic alcohol polyglycol ethers, polyvinylpyrrolidone, alcohol alkoxylates, alkylphenol polyglycol ethers, lignosulfonates, naphthalenesulfonic acid derivatives, and mixtures thereof. This pigment compound is produced by lyophilizing its aqueous dispersion.
